FOREWORD

NATURE knows all secrets, all trades and all professions. What artist would not learn from her that trick of gorgeous coloring in fall—what singer does not envy the voice she gave the lark? She is a preacher when the leaves begin to fall, and flowers die, teaching the impermanence of earthly things. She is the artisan who built the everlasting hills and dug the rivers' channels to the sea; the great historian who wrote the story of the world so plainly that wise men, looking back, can trace the upward struggle of the race. And it is from nature, too, that we learn the value of a shaded light. The glowing splendor of the midnight moon, shedding its soft radiance over hill and valley—what is it but shaded sunlight, glareless and mellow and pleasing to the eye? How does she do it? Nature knows all secrets, all trades and all professions.

But the lesson learned from nature is not entirely lost. Men are also learning to shade the light, employing the most appropriate medium—glass. Science and art and business are progressive, from the primitive and obvious by slow degrees to perfection and the ideal. In the lighting industry, progress has been slow but steady. Crystal glass has been discarded for C. R. I., which in turn gave way to the denser opal glasses. Crystal and C. R. I. were glaring; opal absorbed too much of the beneficial light rays.

Our own particular contribution is Hyperion Glass. We claim for it supremacy in the realm of lighting glassware. It does not merely shade the light effectively and completely; it diffuses almost all of the light generated by the lamp. Hyperion Glass is not an accident. Its discovery and development are the triumphant sequence of experiment and research. The substantial additions to our factory, and the new furnaces just constructed, are the most impressive tributes to its success that we could advance.

If the cumulative experience of future years enables us, we shall make a better glass. In the meanwhile we offer to the trade the finest illuminating glassware ever manufactured—Hyperion.

HYPERION GLASS IS SUPERIOR GLASS

HYPERION UNITS

No. 603

THE lines of this unit are graceful and efficient. This luminaire has decided directional value and thus the largest percentage of its light output is projected downward on the working plane. It is thus of particular value in schools, stores, drafting rooms and offices.

NUMBER	DIAMETER INCHES	DEPTH INCHES	FITTER INCHES	QUANTITY IN CARTON DOZEN	WEIGHT OF CARTON POUNDS	RECOMMENDED WATTAGE	PRICES

RESIDENTIAL LIGHTING

*A*S we have said elsewhere, the enclosing unit is accepted as standard for every type of building other than residential. But the inherent qualities of this type of luminaire, its ability to diffuse a soft and mellow light with complete absence of glare, its adaptability to appropriate attractive decoration, have tended to popularize it for residential lighting also, and in these pages we illustrate distinctive units for every room in the house. Everyone is familiar with the kitchen campaigns conducted by power companies throughout the country which have resulted in the introduction of an effective unit in hundreds of thousands of kitchens. It is safe to assume that no housekeeper with the concrete illustration of the effectiveness of the enclosing unit as an illuminant constantly before her will hereafter willingly return to the glaring light of an unshaded lamp or one insufficiently shaded, and will, in fact, be more prone to utilize the undoubted merits and advantages of this unit in every room in the house. In fact, the tide is flowing steadily in that direction now. So far as bedrooms are concerned, an enclosing unit is the only logical luminaire. Its universal use there is inevitable because it floods the room with a pleasing and mellow light from which all injurious and glaring rays have been filtered. We are illustrating here attractively decorated bedroom units which are being sold in increasing volume by alert and energetic jobbers everywhere, and which are particularly typical of modern and up-to-date bedroom lighting.

In the dining room, the requirements of good lighting demand a luminaire with decided directional value, capable, in fact, of projecting the maximum illumination on the dining room table. A unit represents such an illuminating medium, and when it is appropriately decorated is incomparably the superior of any other system of lighting which could be adopted.

In most modern living rooms there is no adequate system of lighting. The trend has been towards beauty without utility, when it is entirely practicable to secure both in combination. Certainly there ought to be an effective lighting system in reserve, one which could be utilized for reading and other activities or amusements. In this catalog we offer such a unit which is becoming more and more popular and which has already been specified for auxiliary living room lighting in houses and apartments by hundreds of architects.

In fact, the enclosing unit is rapidly, by its own intrinsic merits and efficiency, becoming standard for every type of building and for most purposes of illumination. The alert jobber, dealer and contractor are cognizant of this development and are adjusting their business activities to changing conditions.

Our units, besides being effective in design and attractive in decoration, have the overwhelming advantage of being manufactured from Hyperion Glass—the most efficient lighting glass ever developed.

HYPERION UNITS

No. 650-8087

THE decoration has already been described. The unit shown is another suggestion for efficient bedroom lighting. Glare is of course eliminated and there is an even distribution of soft and mellow light.

HYPERION BATHROOM UNITS

THIS unit and the electric to match, following the decided trend for an appropriate luminaire for every room in the house, were designed particularly for the bathroom. The tile effect is moulded into the glass, and when lighted the unit and electric harmonize perfectly with the tiled walls and floors of the modern bathroom. They are, obviously, particularly adapted for bathroom lighting campaigns, because of their unusual appropriateness and because of their ability to blend with the bathroom furnishings. They are made in Hyperion Glass and consequently, in addition to their decorative value, are of high efficiency.

GILL SYSTEM OF PACKING

ONE of the most annoying and irritating features of the manufacture of glassware, heretofore, has been the high percentage of breakage which attended its shipment. Under the old system of packing in wooden containers, this condition, despite every care that might be taken, was irremediable. Fully appreciative of this truth, we began experimenting, some years ago, with other types of containers and in particular we investigated very thoroughly the practicability of carton packing. Our investigations proved that the corrugated paper carton, as a container of glassware, was not only feasible, but, as we developed it, ideal. In consequence, we have practically eliminated breakage and have given to the trade a sanitary container free from dirt and one which has removed a most fruitful source of irritation, from which sprang most of the misunderstandings which formerly existed between customer and manufacturer.

We were the pioneers also in the elimination of the package charge, notwithstanding the fact that we have greatly improved the mode of packing.

In fine, the interest of our customers is our own interest, and we wish to assure them that we intend to co-operate with them as effectively in the future as we have done in the past.
